

Radon Potential Zone Map for Eastern San Luis Obispo County, California

By

Ronald K. Churchill, Ph.D.
(PG #4265)

June 2008

Scale: 1:100,000

Radon Zone Definitions

- High Potential For Indoor Radon Levels Above Four Picocuries Per Liter**
- Moderate Potential For Indoor Radon Levels Above Four Picocuries Per Liter**
- Low Potential For Indoor Radon Levels Above Four Picocuries Per Liter**

Base Map Layers

- State Route
- Secondary Route/ Street
- County Boundary
- River
- Stream
- Lake
- National Forests and State Parks
- Urban Area

** The U.S. Environmental Protection Agency (EPA) recommends four picocuries per liter as the action level for radon reduction.

MAP USAGE AND LIMITATIONS

This map identifies areas within San Luis Obispo County where geologic conditions are more likely to produce excessive indoor radon levels. The map is intended to be advisory only. It is intended to assist national, state and local governments and organizations in targeting their radon program activities and resources. This map is not intended for determining which buildings have excessive indoor radon levels. Besides geology, local variability in such factors as soil permeability, weather and climatic conditions, building design and condition, and building usage also influences indoor radon levels. Consequently, building-specific radon levels can only be determined by indoor radon testing. No warranty as to actual radon levels at specific sites in San Luis Obispo County is expressed or implied by this map or the accompanying report.

The U.S. Environmental Protection Agency (EPA) recommends that all homes be tested for radon whatever their geographic location. Homes with elevated radon levels have been found in all three zones (High, Moderate, and Low) within San Luis Obispo County. The U.S. EPA recommends that action be taken to reduce radon in homes with an average annual level higher than four picocuries per liter (4 pCi/L).
